

Carrier QRG Auto-Update v1 Runbook

#Objective

Automatically detect and ingest carrier Quick Reference Guide (QRG) updates into Google Drive without manual re-upload, while preserving compliance, quality control, and auditability.

#1) Scope

- In scope: Carrier QRG PDFs/docs, underwriting bulletins, appetite/reference docs tied to carrier access workflows.
- Out of scope (v1): Deep policy form parsing, OCR-heavy scanned images with poor quality, non-authorized source scraping.

#2) Source of Truth

Use Google Drive as canonical storage.

##Folder Standard

'/Carriers/{CarrierName}/QRG/'

##Naming Convention

'{CarrierName}-QRG-{YYYY-MM-DD}-v{N}.pdf'

##Required Metadata (stored in index sheet + file description)

- Carrier name
- Source URL
- Last checked timestamp
- Last changed timestamp
- Previous hash
- Current hash
- Change summary
- Confidence score (high/medium/low)
- Approval status (auto-approved/manual-approved/rejected)

#3) Architecture (v1)

#A) Carrier Registry

Single registry table (Google Sheet or JSON) with one row per carrier source.

Fields:

- 'carrier_name'
- 'source_type' (public_url | portal_url | drive_link)
- 'source_url'
- 'auth_required' (yes/no)

- 'check_frequency' (daily | mon-thu | weekly)
- 'destination_drive_folder_id'
- 'parser_type' (pdf_text | html_text | mixed)
- 'auto_approve_threshold' (e.g., 0.85)
- 'owner'
- 'enabled'

#B) Watcher Agent (scheduled)

Runs by cron and loops enabled rows:

1. Pull source content
2. Normalize text
3. Compute checksum/hash
4. Compare with last known hash
5. If unchanged: log + exit row
6. If changed: save new file, run diff summary, score confidence
7. Route by approval rules

#C) Diff + QA Agent

- Extract text from previous and current versions
- Produce concise "What changed" bullets
- Score confidence:
 - High: structure and key sections matched
 - Medium: partial extraction or moderate structural changes
 - Low: extraction noise, access issues, or major ambiguity

#D) Approval Router

- If confidence $\geq$ threshold and source is trusted: auto-approve
- Else: send to Todd for approval (Telegram/email)

#E) Notification Layer

- Daily digest of changed carriers
- Immediate alert for high-impact changes (major appetite/underwriting updates)

#4) Scheduling

##Default cadence

- Tier 1 carriers (top volume): daily 7:15 AM ET
- Tier 2 carriers: Mon/Thu 7:30 AM ET
- Tier 3 carriers: weekly Fri 8:00 AM ET

##Retry policy

- Retry failed source fetch up to 3 attempts with backoff
- After 3 failures, mark row 'needs_attention' and notify owner

#5) Approval Rules

#Auto-approve when all are true:

- Source is trusted and stable
- Confidence $\geq$ threshold
- Change type is minor/moderate (format refresh, section updates)

#Manual approval required when any are true:

- Confidence low/medium below threshold
- Auth/session anomaly
- Large structure change (possible parsing mismatch)
- New source/domain not previously approved

#6) Security & Compliance Guardrails

- Only monitor sources you are authorized to access.
- Store credentials in secure vault; never hardcode in scripts.
- Enforce least privilege for agent service account.
- Log every access/update event with timestamp and actor.
- Preserve previous versions for rollback/comparison.

#7) Google Drive + Index Design

#Drive

- Canonical folder per carrier
- Archive subfolder optional: '/Archive/'

#Index Sheet tabs

1. Registry (carrier source config)
2. Runs (each check run + outcome)
3. Changes (only changed docs + summaries)
4. Approvals (pending/approved/rejected)

#8) OpenClaw Cron Plan (v1)

#Job 1: 'carrier-qrg-watch-daily'

- Runs Tier 1 registry rows
- Sends summary and approval-needed queue

#Job 2: 'carrier-qrg-watch-mon-thu'

- Runs Tier 2 rows

#Job 3: 'carrier-qrg-watch-weekly'

- Runs Tier 3 rows

#Job 4: 'carrier-qrg-approval-digest'

- Daily digest of pending approvals + stale failures

#9) Suggested Agent Responsibilities (Tool Split)

- OpenClaw: scheduling, orchestration, notifications, run logging
- Manus: extraction + normalization + diff quality improvements
- Lindy: approval workflow (approve/reject), reminder follow-ups
- Loveable (optional): dashboard for registry, run status, and approvals

#10) v1 Deliverables Checklist

- [] Carrier registry created
- [] Drive folder map completed
- [] Hash/diff engine configured
- [] Approval thresholds defined
- [] Cron jobs created
- [] Daily digest enabled
- [] Failure alerting enabled
- [] Pilot with 5 carriers completed

#11) Pilot Rollout (first 14 days)

##Days 1â 3

- Configure 5 highest-priority carriers
- Validate source access + parser behavior

##Days 4â 7

- Enable auto-detect + diff summaries
- Keep approvals manual for all changes

##Days 8â 14

- Turn on auto-approve for high-confidence trusted sources
- Track false positives/negatives and tune thresholds

#12) Success Metrics

- % carriers checked on schedule
- % changes detected correctly
- False positive rate
- Mean time from source change -> Drive update

- Manual approval load per week
- Failed run rate

#13) Immediate Next Actions (for Todd + Henry)

1. Select first 5 carriers for pilot.
2. Create/confirm Drive folder IDs for each.
3. Build initial registry sheet (carrier, source URL, cadence, owner).
4. Define confidence threshold (start at 0.85).
5. Decide approval channel (Telegram + daily email digest).
6. Launch 2-week pilot and tune.
